CLAIMS

What is claimed is:

1. A droplet discharging apparatus comprising:

means for discharging a discharge liquid in the form of droplets through an aperture by mechanically deforming a piezoelectric element by a normal drive signal, and

wherein the droplets are discharged from the aperture by a cooling drive signal, which is different from the normal drive signal.

- 2. The droplet discharging apparatus according to Claim 1, wherein the droplets are discharged for a plurality of times by the cooling drive signal so as to cool the discharge liquid to a specified temperature.
- 3. The droplet discharging apparatus according to Claim 1, wherein the cooling drive signal is set to a low frequency level that does not cause the piezoelectric element to heat the discharge liquid.
- 4. The droplet discharging apparatus according Claim 1, wherein the cooling drive signal has a waveform shape set so as to cause droplets of a maximum weight to be discharged.
- 5. The droplet discharging apparatus according to Claim 1, wherein if the temperature of the discharge liquid detected by a temperature detecting means exceeds a predetermined threshold temperature, then the droplets are discharged from the aperture by the cooling drive signal.

- 6. The droplet discharging apparatus according to Claim 1, wherein if the number of discharges within a predetermined time performed in response to the normal drive signal exceeds a predetermined threshold number of times, then the droplets are discharged from the aperture by the cooling drive signal.
- 7. The droplet discharging apparatus according to Claim 1, wherein cooling discharge by the cooling drive signal is carried out between normal discharges of droplets by the normal drive signal.
- 8. The droplet discharging apparatus according to Claim 1, wherein the discharge liquid is a printing ink.
- 9. The droplet discharging apparatus according to Claim 1, wherein the discharge liquid is an electrically conductive material for forming a wiring pattern.
- 10. The droplet discharging apparatus according to Claim 1, wherein the discharge liquid is a transparent resin for forming a microlens.
- 11. The droplet discharging apparatus according to Claim 1, wherein the discharge liquid is a resin for forming a color layer of a color filter.
- 12. The droplet discharging apparatus according to Claim 1, wherein the discharge liquid is an electro-optic material.

- 13. The droplet discharging apparatus according to Claim 12, wherein the electro-optic material is a fluorescent organic compound exhibiting electroluminescence.
- 14. A film manufacturing apparatus for forming a film of a discharge liquid by using the droplet discharging apparatus according to Claim 1.
- 15. Electronic equipment comprising a device manufacturing by using the film manufacturing apparatus according to Claim 14.
 - 16. A droplet discharging method comprising:

discharging a discharge liquid in the form of droplets through an aperture by mechanically deforming a piezoelectric element, and

wherein the discharge liquid is cooled by cooling discharge, which is different from normal discharge.

- 17. The droplet discharging method according to Claim 16, wherein the cooling discharge is carried out for a plurality of times so as to cool the discharge liquid to a specified temperature.
- 18. The droplet discharging method according to Claim 16, wherein the cooling discharge is set to a low frequency level that does not cause the piezoelectric element to heat the discharge liquid.

- 19. The droplet discharging method according to Claim 16, wherein the cooling discharge causes droplets of a maximum weight to be discharged.
- 20. The droplet discharging method according to Claim 16, wherein if the temperature of the discharge liquid exceeds a predetermined threshold temperature, then cooling discharge is carried out.
- 21. The droplet discharging method according to Claim 16, wherein if the number of normal discharges within a predetermined time exceeds a predetermined threshold number of times, then the cooling discharge is carried out.
- 22. The droplet discharging method according to Claim 16, wherein cooling discharge is carried out during the normal discharge.
- 23. The droplet discharging method according to Claim 16, wherein the discharge liquid is a printing ink.
- 24. The droplet discharging method according to Claim 16, wherein the discharge liquid is an electrically conductive material for forming a wiring pattern.
- 25. The droplet discharging method according to Claim 16, wherein the discharge liquid is a transparent resin for forming a microlens.

- 26. The droplet discharging method according to Claim 16, wherein the discharge liquid is a resin for forming a color layer of a color filter.
- 27. The droplet discharging method according to Claim 16, wherein the discharge liquid is an electro-optic material.
- 28. The droplet discharging method according to Claim 27, wherein the electro-optic material is a fluorescent organic compound exhibiting electroluminescence.
- 29. A film manufacturing method for forming a film of a discharge liquid by using the droplet discharging method according to Claim 16.
- 30. A device manufacturing method for manufacturing devices by using the film manufacturing method according to Claim 29.
